

USING ARTIFICIAL INTELLIGENCE IN JUDICIARY

FOR ASSISTING WITH SIMILAR CASE OUTCOMES
NATIONAL INFORMATICS CENTRE

AI IN JUDICIARY

What is the problem?

- The **Indian Judiciary** administers a *common law system* of legal jurisdiction. The defining characteristic of “common law” is that it arises as precedent.

Who has this problem?

- If a similar dispute has been resolved in the past, the court is usually bound to follow the reasoning used in the prior decision. Here the stakeholder is Lower Judiciary.

Why should this problem be solved?

- Insight gained from 3 crore Case orders and Judgements lying in unstructured pdfs can help judiciary with case summarization and disposal in a time bound manner.

How will I know this problem has been solved?

- System will provide confidence score of the prediction of the incoming case detail categorization along with a listing of similar case outcomes with their confidence scores.

ENVISAGED SOLUTION

Build language model

- ⑩ Build Model on large English text corpus like wiki etc..
- ⑩ It is to be modified with weights using unsupervised learning from legal text corpus
- ⑩ Machine Translation from Hindi legal case outcomes corpus to English
- ⑩ Add to the corpus for building language model. Constraint is availability of parallel corpus.

Build classification model

- ⑩ Use the language model built in previous step
- ⑩ Use annotated data for training model on prediction of case outcome through classification as can be allowed/ rejected/ partly allowed/ settled with confidence score.
- ⑩ Constraint will be amount of annotated data available for machine learning.

Build cognitive search

- ⑩ Build a robust, reliable, fault tolerant, scalable solution that is always available
- ⑩ Require to build search that uses artificial intelligence to return results that are more relevant to the user and the problem at hand
- ⑩ Auto text summarization technique which could quickly and accurately summarize voluminous texts
